

**a** Disease-first evidence synthesis

Central hypothesis: public data triangulation nominates a Curcumin-linked rectal B-cell inflammatory axis in UC/IBD.

Interpretation is tiered: association -> localization -> prioritization -> plausibility -> evidentiary limits.

**b** Candidate convergence

Curcumin: 13 HERB evidence records; 12 B-cell-expressed targets; 11 increased in diseased B-cell pseudobulk

**c** Claim map

|                 | Supported wording          | Not supported                 |
|-----------------|----------------------------|-------------------------------|
| Disease         | UC/IBD mucosal signature   | treatment response            |
| Cell state      | rectal B-cell localization | patient compound action       |
| Target linkage  | Curcumin prioritization    | validated target engagement   |
