

a Supportive checks

Signature sensitivity

B-cell localization is strongest for the replicated top-150 consensus axis; smaller or single-dataset variants are less stable.

Composition proxy

Bulk marker proxy does not show a simple replicated total B-cell fraction increase; M/DC proxy is more consistent.

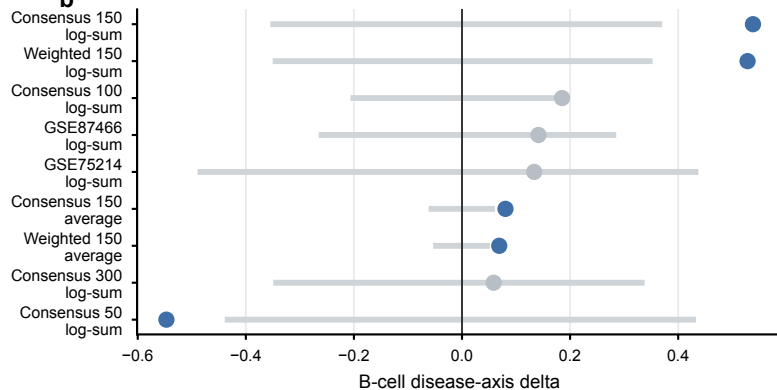

Baseline ranking

A standard target-overlap baseline keeps curcumin near the top but is driven by generic inflammatory overlap.

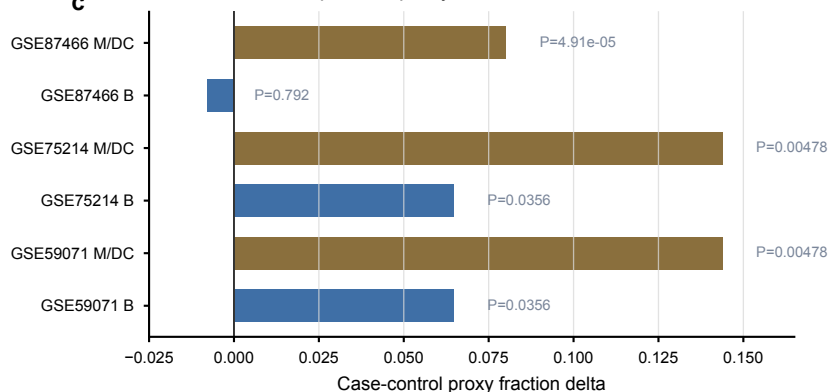

B-lineage replication

GSE182270 shows directionally higher B-lineage module scores in UC, without sample-level significance.

b Signature sensitivity

c Bulk immune-composition proxy

d GSE182270 focused B-lineage replication
