

a Disease-first evidence synthesis

Central hypothesis: public data triangulation nominates a Curcumin-linked rectal B-cell inflammatory axis in UC/IBD.

Interpretation is tiered: association -> localization -> prioritization -> plausibility -> explicit boundary checks.

b Candidate convergence

Curcumin: 13 HERB evidence records; 12 B-cell-expressed targets; 11 increased in diseased B-cell pseudobulk

c Claim boundaries

	Supported wording	Not supported
Disease	UC/IBD mucosal signature	treatment response
Cell state	rectal B-cell localization	patient compound action
Target bridge	Curcumin prioritization	validated target engagement
Full text	BCL6/BLNK/SYK mechanism	cytokines as B-cell-intrinsic
Boundary	ETCM2/LINCS constraints	validation by non-hit layers
